### DISSEMINATION RESTRICTION

This publication is to be disseminated only on a "MUST-KNOW" basis, in keeping with the provisions of TCS 3237-58 (ARC-M-82) as indicated by the SPECIAL HANDLING REQUIRED control stamp. The use of this publication is limited to personnel who require the information for mensuration purposes.

NPIC/TP-5/64

#### **PREFACE**

This publication contains the provisional ephemeris data for Mission 1001-1 and the pitch and roll values for the aft camera as computed from horizon images.

For convenience, the data have been arranged in two parts. Part I pertains to the forward camera and Part II to the aft camera. Within each part the data have been arranged by photographic pass and within a given pass by frame number in ascending order. Ascending (south to north) passes are suffixed with the letter "A" and descending (north to south) passes are suffixed with the letter "D".

A portion of the data was compiled by estimation because of erratic binary operation. The forward camera was erratic at the start and end of many of the passes, and the aft camera was erratic throughout the mission. This unreliable binary operation induces errors in determining the space position of the exposure stations that cannot be reduced. Therefore, this ephemeris is designated provisional since its information is not considered to be as reliable as that for missions with normal binary operation. If further study of the binary operation for this mission reduces the error range to that of a normal operation a revised ephemeris will be published.

The forward camera values for latitude and longitude for both the camera nadir and the format center may be as much as  $\pm$  15 minutes in error. The other readings for the forward camera may be as much as 0.5 percent in error. The aft camera values for latitude and longitude for both the camera nadir and the format center may be as much as  $\pm$  30 minutes in error, and the altitude readings may be as much as  $\pm$  one percent wrong. The other values for the aft camera may be as much as 0.5 percent in error.

NPIC/TP-5/64

#### PREFACE (Continued)

Pitch and roll could not be established for several aft camera frames because of poor or incomplete horizon imagery. These frames have "ND" noted in the aft camera pitch and roll columns. Pitch and roll data are not listed for any of the forward camera frames. However, approximate values may be deduced from the aft camera information if time relationship is used rather than frame numbers. The pitch and roll data should be used from the aft camera frame that has the vehicle time which most closely corresponds to the desired forward camera frame. Pitch values obtained in this manner must then be subtracted from 29 degrees 55 minutes and the sign made positive. Roll values for the desired forward camera frame have the same approximate value and the same sign as those given for the time related aft camera frame.

Yaw values have not been determined for any portion of this mission.

### **DEFINITIONS**

Definitions of certain terms used in this publication follow:

<u>Time Difference</u> - The interval of time in milliseconds between clock readings of consecutive frames. Clock readings are designed to be taken at the time of exposure of the center of the format; consequently, the time difference is approximately the same as the camera cycle period.

 $\underline{\text{Camera Nadir}}$  - The geodetic latitude and longitude of the camera at the time of exposure.

Format Center - The approximate geodetic latitude and longitude of the center of the format as computed from the Camera Nadir position. This computation is based upon the altitude of the camera at the time of exposure and the designed pitch angle of the camera.

Altitude - The distance from the vehicle to the Hough ellipsoid at the foot of  $\mathbf{u}$ he perpendicular.

Velocity - Ground speed of the nadir point (feet per second).

Azimuth - Angle of the ground track with respect to geodetic coordinates.

 $\underline{\text{Pitch}}$  - Longitudinal orientation of the vehicle (sign convention -- positive pitch equals "nose-up" attitude).

 $\frac{\text{Roll}}{\text{--}}$  - Orientation of the vehicle transverse to its own longitudinal axis (sign convention  $\frac{\text{Roll}}{\text{--}}$  positive roll equals "left-wing-up" attitude).

<u>Yaw'</u> - Orientation of the vehicle about the axis passing through it and through the camera nadir position (sign convention -- positive yaw for counter-clockwise rotation when viewing the ground nadir from the vehicle position).
